Cradle to Grave Overview

The Cradle to Grave feature is an extension of the existing Call Trace functionality that allows more users to troubleshoot issues by presenting high level info in plain English.

The Call Trace is a comprehensive listing of all technician information captured during a call. While this is useful for isolating problems, it's also more information than non-technical user generally needs. By presenting the Cradle to Grave information, non-technical users are empowered to see where a call may be failing and be able to fix or report the issue without escalating the issue.

If needed, the full Call Trace information is available by pressing the View SIP Flow button.
